DOCUMENT 1 OF 4 · RESEARCH FINDINGS

Who else is doing this, and how far along are they

A close look at three companies — what they sell, who runs them, who paid for them, and how big they really are. Written in plain words, with every number sourced and every gap in the evidence marked as a gap rather than filled in with a guess.

Researched 17 August 2026 · 3 companies · public sources only · Ten sections

PAGE 1 · START HERE

1 The short version

If you read nothing else, read this. Two of the three are real competitors. The third is not a competitor at all, and finding that out is itself useful.

Workroom Automation

REAL COMPETITOR

Hyderabad. Building almost exactly what you are building — a “factory operating system” that plans and runs the whole plant. **Six people. Raised about ₹6.2 crore.** Big-name customers already.

The closest thing to a mirror of XELOR that exists in India today.

Seewise.AI

ADJACENT COMPETITOR

Chennai, Singapore and Ohio. Turns a factory’s existing CCTV cameras into AI that watches machines and people. **42 people. No venture money raised.** Very large logos on the wall.

Solves a different slice of the same problem — and sells it far better than anyone else here.

Geeplex

NOT A COMPETITOR

Hosur and Singapore. An IT services and computer-reselling business. Sells laptops, servers, antivirus, cybersecurity and consulting. **Registered May 2024.**

Nothing here competes with you. Section 8 explains why they may have been on your list anyway.

The one-line summary. Workroom is your direct rival and is ahead of you on money and customers. Seewise is not really a rival on product, but is far ahead of everyone on *how to sell to a factory* — and that is the part you can copy fastest and cheapest. Geeplex can be crossed off the list.

The numbers side by side

	Workroom Automation	Seewise.AI	Geeplex
What they sell	Software that plans and runs the whole factory	AI that watches the factory through its cameras	IT services and computer hardware
Started	2022	2022	Registered May 2024
Head office	Hyderabad, India	Ohio, USA · also Singapore & Chennai	Hosur, Tamil Nadu · also Singapore
People	**6**	**42**	Not listed anywhere
Money raised	**₹6.2 crore** (about $750,000)	**None from investors** — accelerator-backed	None found
LinkedIn followers	609	**6,039**	None found
Pages on their website	5	**About 90**	About 12, from a template
Named customers	4	**12 logos + 8 named quotes**	None
How close to you	Very close	Next door	Not close

Headcount, follower counts and locations from a company-data lookup run on 17 Aug 2026. Funding from press coverage of the round. Page counts from each company's own sitemap.

PAGE 2 · WORKROOM

2 Workroom Automation — what they actually sell

This is the company to watch. They are building the same idea as XELOR Core, they got there first, and they have paying customers with names you would recognise.

Their pitch, in their words

> **"A software that thinks like your best planner & executes like your best supervisor."**
>
> That single line is doing a lot of work. It avoids every technical word, and it tells a factory owner exactly what they get: the judgement of the best person in the building, available all the time.

Underneath, they describe themselves as a **"Factory Operating System"** — one place to plan and run everything from raw material arriving to the finished goods leaving. Elsewhere they call it a "no-code connected process automation platform", meaning a factory can build its own screens and workflows without a programmer.

The nine pieces they list

Planning Engine
Builds the production plan around what the factory can actually do — machines, people, materials.

Production Execution
Watches the day as it happens and updates live.

Traceability Engine
Follows a part all the way through, batch by batch.

Workflow Engine
Lets the factory set up its own rules and steps.

Web & shop-floor apps
Different screens for the office and for the floor.

Reports & dashboards
The numbers, arranged how each role needs them.

Suggestions & forecasts
The AI part — it recommends, it does not decide.

Integrations
Connects to the ERP, the machines and the sensors.

Security
Enterprise-grade data handling.

> **Notice how close this is to your list.** Their nine pieces and your nine agents cover almost the same ground. The difference is that they are named after *jobs the factory understands* — planning, execution, traceability — and yours are named after departments the factory has never heard of. That is a naming choice, not a product gap, and it is worth ten minutes of your time. More on this in Document 2.

Who is paying them

Customer	Who they are	What Workroom claims it did
Apollo Tyres	One of India's largest tyre makers	Cut the manual job of assigning workers from **60 minutes to 5 minutes**
Hindustan Pencils	The Apsara / Nataraj pencil group	Targeting a **10–12% improvement** in productivity and machine effectiveness
ALSTEF Group	French airport and warehouse automation group	Automated planning and live order tracking down to the individual part
Plumage	Manufacturer	One single source of truth for all quality data

> **Be honest with yourself about this row.** Apollo Tyres and ALSTEF are exactly the kind of logo that opens doors. A six-person company won them. The barrier to a factory saying yes is lower than it feels from where you are sitting — but it is not zero, and the next section explains what got them in.

PAGE 3 · WORKROOM

3 Workroom — the money and the people

₹6.2 cr raised in one seed round

~$750k the same money in dollars

6 people on the team

2022 year they started

Who put money in

The round was announced on **23 March 2026** — five months ago. It was led by the **Equirus InnovateX Fund**, the venture arm of Equirus, an Indian financial services group. Two other funds joined: **Astir Ventures** and **Venture Catalysts Group** (one of India's largest early-stage investor networks).

Alongside the funds, a group of individuals put in their own money. This matters more than it looks:

Angel investor	Where they are from
Bhavik Dholakia	Swatantra Wealth
Vishal Shah	Shah Invest
Bhavin Sodavadiya	Bhagwat Realty
Dr Varun Patel	Individual investor
Dr Viraj Lavingia	Individual investor

> **Why the angel list is worth studying.** These are wealth-management, investment and real-estate names, mostly Gujarati business families — not technology investors. That is a very Indian way to raise a first round: you go to business families who own or supply factories, because they understand the problem without being taught. **You have a version of this available through CoSol's customer base and the Peenya association.**

The two founders

Abhinav Atthota — Chief Executive

A software engineer. Before Workroom he built virtual-reality and 3D systems for industrial clients: a **VR fire-emergency training simulator for one of India's largest pharmaceutical companies**, and a **full 360° virtual factory tour for one of the Netherlands' largest agriculture manufacturers**.

Listed in Forbes 30 Under 30 Asia.

Rohan Agarwal — Chief Technology Officer

A software engineer, co-founder from the start. Also carries a **Forbes 30 Under 30** listing alongside Abhinav.

Less public detail is available on his individual background than on Abhinav's.

> **The lesson hiding in Abhinav's history.** He did not start with a factory operating system. He spent years doing **paid project work inside factories** — VR training, virtual factory tours — and that is how he learned the problem and met the buyers. The product came after the access. **You already have that access through CoSol.** Most founders have to buy it with years of their life.

What they said the money is for

Their stated plan: improve their AI planning engine, build deeper connections into ERP and MES systems, and hire salespeople. Their founder's public line was:

> "Manufacturing enterprises today do not suffer from a lack of software or data, but from a lack of **context and connected intelligence**." — Abhinav Atthota
>
> This is almost word-for-word your own argument. You are not wrong about the problem. You are simply not the only one who has noticed.

PAGE 4 · SEEWISE

4 Seewise.AI — what they actually sell

A different product to yours, aimed at the same buyer. They put AI on the cameras a factory already owns, and let it watch the machines and the people.

Their pitch, in their words

> **"Turn your regular CCTV into smart AI cameras."**
>
> Nine words. No jargon. It tells the buyer what they need (nothing — they already have the cameras), what changes, and what they get. This is the best single sentence produced by any of the three companies, and it is worth studying rather than admiring.

The bigger claim on their homepage is "10x your Operations & Safety with Vision AI Agents". Their product breaks into three named pieces, all in plain language:

Safety AI

Spots people without helmets, forklifts too close to workers, fire risks, and bad lifting posture.

Production AI

Checks that the correct steps were followed, tracks stoppages, measures how each operator is doing.

Tracker AI

Follows trucks in and out, manages parking, and digitises the weighbridge.

Where they say it works

They organise everything two ways at once — by **industry** and by **specific factory problem**. Their industry pages cover automotive, food and beverages, iron and steel, and warehouses. Their solution pages are each named after one job:

- Furnace monitoring · galvanising tracking · press shop monitoring
- Quality control · people presence monitoring
- Truck loading · weighbridge automation

> **This double structure is the single most copyable thing in this research.** A steel plant manager lands on "furnace monitoring" and immediately sees their own job. They never have to work out whether a general platform applies to them. Document 2 covers how to do the same for XELOR.

The numbers they put on the wall

42,000+
hours of downtime cut

22,000+
safety incidents caught

117,000+
defects found

16.6%
productivity increase

Elsewhere they claim **25+ active clients, 30+ worldwide, 35+ modules built, 3 years in business, 11,000+ accidents prevented** and **7,200 assembly cycles corrected**.

> **Treat these as marketing, not audited fact.** None of them is independently verified and several overlap oddly — 22,000 incidents on one page, 11,000 accidents on another. The lesson is not the numbers. It is that **they never make a claim without a number attached**, which makes the whole site feel measured rather than boastful. Your deck already does this well; their website does it better than yours.

PAGE 5 · SEEWISE

5 Seewise — the money, the people, the logos

42
people

₹0
venture money raised

6,039
LinkedIn followers

3
countries with an office

They have not raised venture money — and they are ten times your size

This is the most surprising finding in the whole research, and the most encouraging one for you. Company databases show **no institutional funding round** for Seewise. What they have instead is:

- Backing from the **CII Centre of Excellence for Innovation, Entrepreneurship and Startups** — the Confederation of Indian Industry, the country's main manufacturers' body
- A place in **The Ignition AI Accelerator** in Singapore
- A listing as an **Intel partner**, with their own page on Intel's partner showcase

> **Read that again.** A 42-person company selling to Coca-Cola and Honda, built without a venture round, funded by customers paying for the product. Being backed by an industry body (CII) rather than a fund gave them credibility *and* a route to members. **The Peenya industries association is your CII.**

The founder

Balaji D Loganathan — Founder and Chief Executive

Described as having deep roots in manufacturing and first-hand experience of industrial waste. He has said he started the company after watching preventable losses — breakdowns, inefficiency and injuries — happen over and over.

His line about winning sceptical factory buyers is worth keeping:

"Once we presented the data showing a clear return on investment, even the staunchest sceptics started to notice."

The logos they show

These appear as customer logos on their homepage:

Type	Names shown
Global consumer brands	Coca-Cola, PepsiCo, Panasonic, Daikin
Car makers	Honda, Hyundai, ZF, Rane
Indian industrial groups	L&T, TTK Prestige
Other	Changi Airport (Singapore), Flipkart

Eight named people who vouched for them

Separately from the logos, they publish **real quotes from real named staff at named companies** — which is much harder to fake and much more persuasive:

Person	Role and company	What they said
Piriya Luadlai	IT Infrastructure & Operations, **Daikin**	Better visibility, easy to use, live alerts
Vijay Bhaskar	Head of IT, **Electrosteel**	Automated pipe counting improved accuracy a lot
Arjun R	Maintenance, **HCCB** (Coca-Cola bottler)	Better machine monitoring and safety compliance
Rajendra Soni	Digital Transformation Lead, **KEC**	Galvanising AI raised output across several plants
Krishnakant Mishra	IT General Manager, **Crescent Foundry**	Truck system rolled out to all four factories
Bhaskar Hazra	Production In-Charge, **Kiswok**	Failure-mode analysis stood out
V. Lakshmi Narasimhan	Team Leader, **Turbo**	**5% less downtime, 3–4% less power, 4% more output**
Anonymous	Safety Manager, large car maker	Helmet-detection AI impressed on safety

You have nothing like this, and it is the single biggest credibility gap between you and them. One named quote from one named person at one real factory is worth more than any architecture document. Your first pilot must be structured to produce one.

PAGE 6 · SEEWISE

6 Seewise — how they get in the door

Their product is good. Their *selling machine* is what actually separates them, and almost all of it is available to you for free.

The 14-day pilot — their best idea

They offer a **14-day pilot**. Free analysis of the site. It runs on the cameras the factory already owns, so there is nothing to buy up front. Support around the clock while it runs.

Why this works so well. It removes every reason to say no. No purchase, no installation, no risk, no long commitment. A plant manager can approve a two-week trial without asking anyone above them. Compare that with asking the same person to approve a new ERP.

They publish exactly how the rollout goes

Step	What happens	Why publishing it matters
1	They visit, look at the site, and fit cameras where needed	The buyer can picture day one
2	The AI is trained remotely in **48 hours**	A specific number, not “quickly”
3	It goes live inside the factory at about **60% accuracy**	**They admit it starts imperfect**
4	Testing and go-live, reaching about **98% accuracy**	The buyer knows what “finished” means

> **Step 3 is the clever one.** Admitting the system starts at 60% makes every other number they publish more believable. It is the same instinct as your "what does not work yet" slide — you already understand this move. They apply it to the *delivery process*, not just the product.

The content machine

Their website carries roughly **90 pages**. Of those, **56 are blog posts** written for factory people: how AI cuts energy costs in foundries, what changes on a shop floor when AI goes live, why a pilot is different from production. This is how strangers find them without a sales call.

They are hiring salespeople, not just engineers

Ten open roles are listed. What they are is revealing:

Building the product (7)

Computer vision engineer, machine-learning engineer, data annotator, Python developer, project manager, product delivery associate, business analyst.

Selling it (3)

Business development manager, business development specialist, **channel partner manager**.

> **"Channel partner manager" is the most important job title in this entire document.** It means they have stopped selling one factory at a time and started recruiting other companies to sell for them. **CoSol is exactly that kind of partner — and you are already inside it.** They are hiring for a relationship you were born with.

Two other commercial moves

- **They run a separate consulting business** at `consulting.seewise.ai` — engineering services alongside the product. That pays the bills while the product revenue builds. It is very likely part of how they grew to 42 people with no investor money.
- **They are moving from one-off sales to a monthly subscription**, so the factory pays out of its running budget rather than its capital budget. Running-cost money is far easier to approve than a capital purchase.

PAGE 7 · HOW THEY WRITE

7 How each one explains itself

You asked how well they put their solutions and use cases across. Here is the answer, with the actual templates they use — because the templates are the reusable part.

Seewise's case-study template

Every one of their six case studies uses the same six blocks, in the same order:

Block	What goes in it
1. Header	Title, the headline number, the industry, the type of job, the impact in one line
2. The Challenge	Bullet points of what was going wrong before
3. The Solution	What was switched on
4. How It Works	Step by step, from camera to action
5. Impact	The numbers that changed
6. Business Value	What it means for the business, not the technology

They also **hide the customer's name in the case studies** — "a metal foundry", "an automotive components maker" — while showing logos elsewhere. That lets them publish detail a named customer would never approve.

Seewise's solution-page template

Taking their quality-control page as the example, the order is:

1. A headline that names the outcome, not the technology
2. **"Quality Inspection Today Is Broken"** — the problem, stated bluntly
3. A four-step picture of how it works: Detect → Capture → Learn → Improve
4. Four specific jobs it does, each with a hard number (99.8% accuracy, ±0.01mm)
5. Why they are different from the alternatives
6. **A comparison table** putting them against old vision systems and generic AI tools
7. "What You Achieve" — four plain outcomes
8. A closing vision paragraph, then **"Request Demo"**

> **Point 6 is the move worth stealing.** They put a table on their own website comparing themselves against the alternatives. Most companies are too nervous to name the competition. Doing it makes them look confident and saves the buyer the work — and your deck already has this instinct on the "nobody has all three" slide.

Workroom, by contrast

> **Their solution pages contain no numbers and no customers at all.** Every metric they own sits on the homepage. Click into "Workforce Planning" and you get features and a screenshot — no proof, no story, no reason to believe. **This is a real weakness in a much better-funded competitor, and it is an opening for you.**

Scored side by side

How well they do it	Workroom	Seewise	XELOR today
Explains itself without jargon	Strong	Strong	Improving
Specific factory jobs named	Some	Excellent	None
Case studies with numbers	Four one-liners	Six, full	None
Named people vouching	None	Eight	None
Easy first step for a buyer	Book a demo	14-day pilot	Not defined
Content that pulls people in	None	56 articles	None
Honest about limits	No	On process only	Yes — best of the three
Depth of the actual product	Strong	Narrower	Strong

PAGE 8 · GEEPLEX

8 Geeplex — not a competitor, and here is the proof

Worth reading anyway, because knowing why they are not a rival tells you something about how crowded this space really is.

What they actually sell

Their own website lists six services: **cybersecurity, AR/VR development, IT consulting, software development, IT product sales and IT auditing**. Their products page sells **laptops, desktop computers, servers, operating systems, office software and antivirus**.

That is an IT services and hardware-reselling business. It is a legitimate business. It is not manufacturing software.

The company on paper

Registered name	Geeplex Tech Solutions Private Limited
Company number	`U46909TZ2024PTC031547`
Incorporated	**16 May 2024** — about 15 months old
India office	FORT Hosur, SIPCOT Phase 2, Moranapalli, Hosur, Tamil Nadu 635109
Singapore office	3 Soon Lee Street, Pioneer Junction
Contact	info@geeplex.com · +65 6044 1975 / +91 98400 44290
In company databases	**Not found** — no headcount, no funding, no LinkedIn record

Three signs the business is very early

- **The website is an unfinished template.** The contact link at the top of their home page still points at `mailto:contact@example.com` — the placeholder that ships with the template.
- **The security certificate has expired**, so most browsers now show a warning before the site opens.
- **Their entire IoT page is three product names** — “T-Remo”, “DC Device”, “DA Device” — with no description of what any of them does.

Why they might have landed on your list. They are in Hosur, an industrial town, and they mention connecting industrial equipment. If they ever build that out they would be a small local integrator, and integrators are **partners, not rivals** — the sort of company that would resell XELOR rather than compete with it. Worth a friendly conversation one day; not worth watching.

PAGE 9 · READING THE FIELD

9 What all this says about the market

Five things the research proves

1. The problem is real and others see it

Workroom's founder says factories lack "context and connected intelligence", not software. That is your argument, made independently, and funded. **You are not wrong about the problem.**

2. Factories will buy from very small companies

Six people won Apollo Tyres and a French airport automation group. Size is not the barrier you fear. **Proof is.**

3. You do not need investors to get big

Seewise reached 42 people and Coca-Cola with no venture round — funded by customers and a consulting arm. That is a genuine path, not a fallback.

4. Nobody wins on architecture

Not one of the three sells on how well their software is built. They sell named jobs and numbers. **Your strongest asset is currently invisible to a buyer.**

5. The clock is running

Workroom raised five months ago and is spending it on sales and ERP connections — the exact ground you would compete on. They will be further ahead in six months.

And one gap nobody has taken

Neither competitor offers the honesty you already have: a published list of what does *not* work yet. In a market full of AI claims, that is a real position — if you make it loud instead of buried.

Where each of them is weak

Company	Their soft spot
Workroom	Six people running deployments at Apollo Tyres and an international group. Support and delivery will stretch. Their solution pages carry no proof at all. No content bringing in new buyers. Very small public presence (609 followers).
Seewise	They only see what a camera can see. They cannot take an order, plan the work, raise a purchase order or run the books. **They are a sensor on the wall; you are the system of record.** A factory needs both — and they cannot become you nearly as easily as you could add cameras.
Geeplex	Not competing. Possible future reseller.

PAGE 10 · CONFIDENCE

10 What I could not find, and how sure I am

A research document that does not mark its own weak spots is not research. Here is exactly where the evidence is solid and where it is thin.

Finding	Confidence	Why
Workroom raised ₹6.2 crore, led by Equirus InnovateX	High	Reported by eight separate outlets with matching detail
Workroom's founders and their backgrounds	High	Named consistently across coverage and their own LinkedIn profiles
Seewise has 42 people; Workroom has 6	Medium	From one company-data provider. Other sources give Workroom "1–10", which agrees. Treat as close, not exact.
Seewise has raised no venture money	Medium	Two databases show no round. An unannounced round would not appear.
Seewise's revenue	Low — ignore	One provider estimates $10m–$50m. For 42 people that looks far too high. **I would not repeat this number to anyone.**
Seewise's impact claims (42,000 hours etc.)	Low	Their own marketing, unverified, and internally inconsistent between pages
Seewise's customer logos	Medium	A logo can mean a pilot, a trial, or one small site. The eight named quotes are much stronger evidence.
Geeplex is not a competitor	High	Read directly from their own website and their company registration

Things I could not get

- **What either company charges.** Neither publishes pricing. This is normal in industrial software and it means you cannot benchmark your own price from public sources — you will have to learn it from lost deals.
- **Individual staff lists.** LinkedIn blocks automated reading of member lists. Founders are confirmed; the rest of both teams is not.
- **Seewise's founding month and full history.** Their own about page has no founding story and names no team members — an odd gap for a company otherwise so well presented.
- **Whether Workroom's customers are live or in pilot.** "Targeting 10–12%" for Hindustan Pencils suggests at least one is still a target, not a result.

> **One honest caution about all of it.** Everything here comes from what these companies chose to publish about themselves, plus press coverage they placed. Nobody publishes their churn, their failed pilots or their support backlog. Assume both are somewhat less polished on the inside than they look from outside — the same way XELOR looks from theirs.
